

Consistency, Not Talent — Portfolio Content and Visual Identity

One-Line Claim

“ I build practical AI, machine learning, automation, and software solutions that turn complex problems into useful working systems.”

This is the main message I want visitors to remember after viewing my portfolio. It connects the different types of work I have built, including AI workflows, machine learning projects, automation, and custom software.

1. The Through-Line: Content Map and CTAs

Main Visitor Goal

The main action I want a visitor to take is:

Start a conversation about working together on an AI, automation, machine learning, or software project.

All important calls to action across the portfolio should eventually lead toward this action.

Page 1: Home

Sections in Order

1. Hero Section

The first section introduces who I am and what I build.

Main message:

I build practical AI, machine learning, automation, and software solutions.

Supporting text briefly explains that I work on projects involving AI systems, automation workflows, machine learning, and custom applications.

Primary CTA: View My Work

Secondary CTA: Let's Work Together

2. Featured Work

This section highlights my strongest and most relevant projects first.

Featured projects include:

- Business Inventory Management System
- AI-powered SRS / Requirements Assistant
- AI Automation and n8n Workflow Projects
- Machine Learning internship work and experiments

The purpose of this section is to quickly show that I have actually built working projects rather than only listing skills.

CTA: Explore Project

3. What I Work With

This section gives a short overview of my main areas:

- Machine Learning
- AI Systems
- AI Automation
- AI Agents
- n8n Workflows
- Custom Software Development

This section should remain simple and support the project work instead of becoming a large skills wall.

CTA: View All Work

4. Selected Proof

This section uses real project screenshots, workflow diagrams, code previews, dashboards, or system interfaces.

The goal is to show evidence of the work.

CTA: See Case Studies

5. Final Call to Action

The final section invites visitors to start a conversation.

CTA: Let's Build Something

This leads to the contact page or contact section.

Page 2: Projects / Work

This page contains the full collection of my work.

Sections in Order

1. Page Introduction

A short introduction explaining that these projects show how I approach real problems using software, AI, automation, and machine learning.

2. Featured Project: Business Inventory Management System

This project appears first because it demonstrates a complete working system.

The project includes:

- Inventory management
- Product management
- Barcode-related functionality
- PostgreSQL / Supabase database
- ASP.NET Core API
- React frontend

CTA: View Case Study

3. AI-Powered SRS Assistant

This project focuses on helping users generate and structure software requirements.

The system includes:

- Interactive requirement gathering
- Requirement categorization
- Conflict detection

- SRS generation
- Database and authentication functionality

CTA: View Case Study

4. AI Automation Workflows

This section shows automation projects created with tools such as n8n.

Examples include workflows involving:

- Order information
- WooCommerce data
- Delivery information
- Google Sheets
- Automated processing

CTA: View Workflow

5. Machine Learning Work

This section presents relevant ML experiments, internship assignments, baseline models, data analysis, and future ML projects.

The work should show the process as well as the result, including:

- Data understanding
- Feature selection
- Baseline scoring
- Evaluation
- Decision-support thinking

CTA: Explore ML Work

Page 3: Individual Case Study

Each major project should have its own detailed page.

Sections in Order

1. Project Overview

What problem was being solved?

2. The Problem

Explain the original challenge clearly.

3. My Approach

Show how I approached the problem.

This can include:

- Planning
- Data design
- System architecture
- AI workflow design
- Development decisions

4. The Build

Show the actual implementation using screenshots, diagrams, workflows, or code architecture.

5. Tools and Technologies

List only the tools actually used in the project.

6. Outcome and What I Learned

Explain what was completed and what I learned during the process.

I will avoid inventing business results or performance numbers that I cannot prove.

CTA: View Next Project

At the end of the case study, the visitor can continue exploring my work.

Page 4: About

Sections in Order

1. Short Introduction

A simple introduction about my interest in technology, AI, machine learning, automation, and software development.

2. How I Work

I want this section to explain that I enjoy turning ideas and problems into working systems.

My process focuses on:

- Understanding the problem
- Choosing appropriate tools
- Building practical solutions
- Testing and improving the result

3. Current Direction

My current focus is developing further in:

- Machine Learning
- AI Engineering
- AI Automation
- MLOps
- AI Agents

CTA: View My Work

This directs visitors back toward the project portfolio.

Page 5: Contact

Sections in Order

1. Simple Heading

Have a project in mind?

2. Short Supporting Text

I am interested in discussing projects involving AI, machine learning, automation, AI agents, and custom software.

3. Contact Options

Possible contact methods include:

- Email

- LinkedIn
- GitHub
- Contact form

Primary CTA: Start a Conversation

This is the final action that the rest of the portfolio leads toward.

Still Need to Gather

To complete the portfolio properly, I still need to gather and organize the following proof:

- Clean screenshots of the Business Inventory Management System
- Screenshots of the AI-powered SRS Assistant
- Screenshots or diagrams of AI automation and n8n workflows
- GitHub repository links for projects that are ready to share
- Project architecture diagrams where useful
- Screenshots of dashboards, forms, APIs, or working interfaces
- A live demo link for projects that are deployed
- Machine learning project results and evaluation outputs
- A professional profile photo if I decide to include a personal image

I will use real screenshots and real project evidence for my work rather than generating fake AI images of projects.

2. Decide Once: My Identity Kit

Typography

Primary Font: Inter

I will use Inter for headings, body text, navigation, buttons, and labels.

I chose one font with different weights because it keeps the portfolio clean and consistent while still allowing visual hierarchy.

Suggested usage:

- **Headings:** Inter Bold or SemiBold
- **Body text:** Inter Regular
- **Small labels:** Inter Medium

- **Buttons and navigation:** Inter Medium

Color Palette

Purpose	Color	Hex Code
Main background	Deep near-black	#050505
Secondary dark surface	Dark charcoal	#0B0B0B
Main text	Soft white	#F5F5F5
Accent / interactive color	Royal blue	#2F55E7

The palette intentionally uses a small number of colors.

Royal blue is used for important interactive elements such as:

- Links
- Primary buttons
- Important highlights
- Selected states
- Small visual accents

It should not be used everywhere.

The projects, screenshots, data, and case studies should remain the most visually important parts of the site.

Logo / Favicon

The logo or favicon will use a simple minimal mark based on my portfolio identity or initials.

It should:

- Work at a small size
- Be readable on a dark background
- Use the same white and royal blue visual system
- Avoid generic robot or AI imagery
- Avoid unnecessary effects

The favicon is meant to identify the portfolio, not become a large visual element.

Style Note

Fonts: Inter, using a small number of weights to create hierarchy.

Colors: #050505 background, #0B0B0B secondary surfaces, #F5F5F5 text, and #2F55E7 as the single accent color.

Mood: Premium, modern, calm, and technically confident. The interface should feel intentional and spacious, while the projects, screenshots, workflows, and results remain the main focus.

3. Kill Your Darlings: Image Curation

Images the Portfolio Actually Needs

Real Project Images

For my actual work, I will use real captures of:

- Business Inventory Management System
- AI-powered SRS Assistant
- AI automation workflows
- n8n workflow diagrams
- Machine learning notebooks or visualizations where useful
- Application dashboards and interfaces
- System architecture diagrams
- GitHub or deployment previews where relevant

These images provide evidence that the work actually exists.

Generated Images

I will only consider AI-generated visuals for small supporting areas of the portfolio, such as:

- Abstract section backgrounds
- Subtle technical textures
- Decorative visual elements that connect sections

Any generated images should follow the same visual direction:

- Minimal
- Dark
- Clean
- Abstract

- Professional
- No humanoid robots
- No generic glowing AI brains
- No neon cyberpunk effects
- No excessive gradients

Generated visuals should support the content without competing with it.

Image Rejection Note

I rejected the idea of using a large AI-generated hero image with a robot or futuristic technology scene.

Although it could look visually impressive, it would not provide evidence of my actual work. It could also make the portfolio feel generic because many AI and technology portfolios use the same type of imagery.

Instead, I chose a cleaner hero with strong typography, controlled spacing, and real project screenshots further down the page. This decision better follows the rule that the design should frame the work, not upstage it.

Final Design Decision

My portfolio will use a consistent visual system based on:

- One font: Inter
- Four controlled colors
- A dark premium interface
- Royal blue used as a restrained accent
- Generous spacing
- Minimal decoration
- Real screenshots as the primary visual proof

The goal is for a visitor to remember the projects and the systems I built, not just the website design.

Final Thing

The most important decision I made was to keep the portfolio visually restrained. Since my work includes AI, machine learning, automation, and software projects, the strongest proof comes from showing real systems, workflows, interfaces, and results.

AI can generate many visually impressive images, but an impressive image is not automatically useful. For this portfolio, I chose consistency and real proof over unnecessary decoration.
